Project Title: Provision of Service for a Study on the Planning and Management of Hong Kong Geopark

Project Abstract:

A geopark is a unique natural area with special geological significance which serves three objectives of conservation, education and sustainable development. The establishment of Hong Kong Geopark aims to conserve the unique landforms and landscape in the territory. Through protecting the physical environment, the survival base for sustaining local biological species and communities can be conserved.

It is planned to make application for the Hong Kong to be listed as a national geopark in 2009 and then further as a global geopark in the near future.

This project aims to prepare two pieces of required documents for the geopark application: the master plan of Hong Kong Geopark and the handbook for field interpreters.
